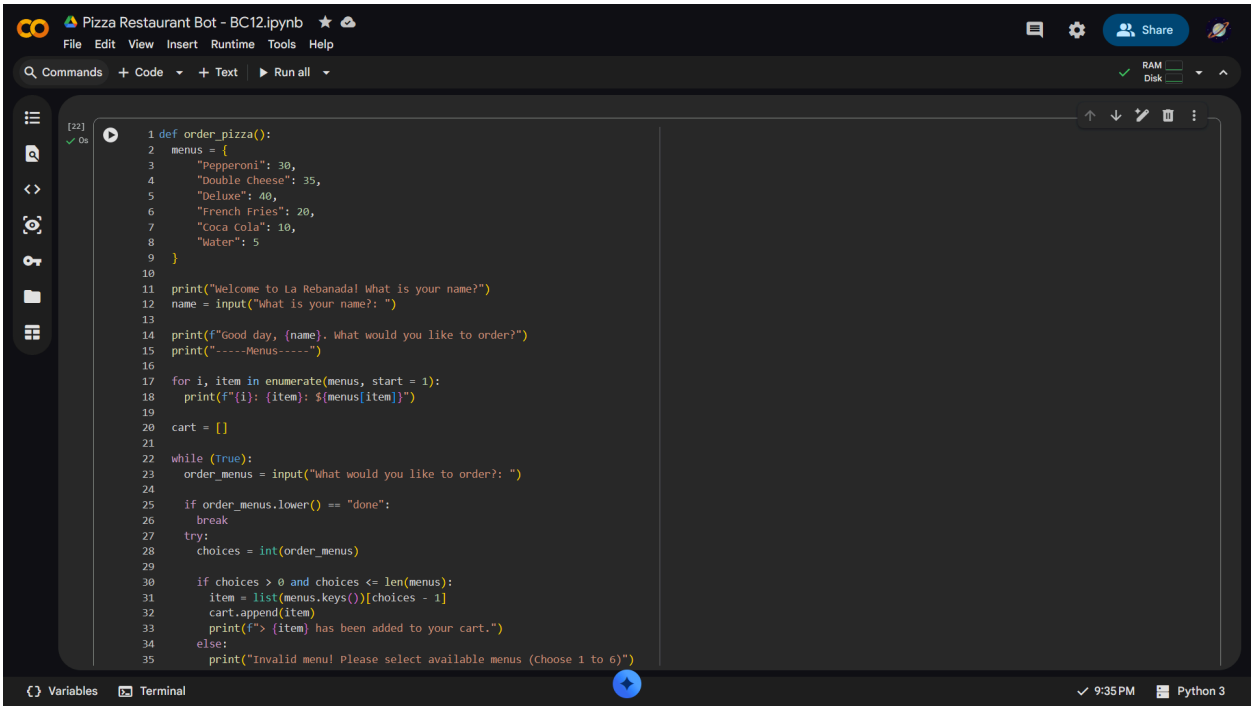
My Code



```python
def order_pizza():
  menus = {
      "Pepperoni": 30,
      "Double Cheese": 35,
      "Deluxe": 40,
```

```
        "French Fries": 20,
        "Coca Cola": 10,
        "Water": 5
    }

    print("Welcome to La Rebanada! What is your name?")
    name = input("What is your name?: ")

    print(f"Good day, {name}. What would you like to order?")
    print("-----Menus-----")

    for i, item in enumerate(menus, start = 1):
      print(f"{i}: {item}: ${menus[item]}")

    cart = []

    while (True):
      order_menus = input("What would you like to order?: ")

      if order_menus.lower() == "done":
        break
      try:
        choices = int(order_menus)

        if choices > 0 and choices <= len(menus):
          item = list(menus.keys())[choices - 1]
          cart.append(item)
          print(f"> {item} has been added to your cart.")
        else:
          print("Invalid menu! Please select available menus (C
hoose 1 to 6)")
      except ValueError:
        print("Invalid input! Please enter a number or 'done' t
o finish ordering")

    if len(cart) == 0:
```

```
    print("No items ordered. See you next time!")
    return
  else:
    print("-----Summary of Your Order-----")
    for item in cart:
      print(f"{item}")

    total_price = sum(menus[item] for item in cart)
    print(f">> Total price: ${total_price}")

  print("-----Payment Methods-----")
  payment = ["Credit/Debit Card", "Cash On Delivery", "Prompt
Pay"]
  for i, item in enumerate(payment, start = 1):
    print(f"{i}: {item}")

  while(True):
    try:
      payment_user = int(input("Please enter your payment:
")) - 1
      if (payment_user >= 0) and (payment_user < len(paymen
t)):
        print(f"Thank you, {name}. Paid via {payment[payment_
user]}. Your food will be ready in 30 minutes")
        break
      else:
        print("Invalid payment! Please select available payme
nt (Choose 1 to 3)")
    except ValueError:
      print("Invalid input! Please enter a number")

order_pizza()
```

Steps

In this code, I use based Python. Meaning no library requires.

And the function created as `order_pizza()` with require no argument.

Start of with menus. I stored data in dictionary.

```
menus = {
    "Pepperoni": 30,
    "Double Cheese": 35,
    "Deluxe": 40,
    "French Fries": 20,
    "Coca Cola": 10,
    "Water": 5
}
```

Next, I use `input()` to welcome a customer and also ask customer name for greeting.

```
print("Welcome to La Rebanada! What is your name?")
name = input("What is your name?: ")

print(f"Good day, {name}. What would you like to order?")
```

Then I printed out menu list to allow customer to know menu name, menu number, and price.

In R, I just manually create a menu list but in Python, I use `for` loop instead.

```
print("-----Menus-----")

for i, item in enumerate(menus, start = 1):
  print(f"{i}: {item}: ${menus[item]}")
```

Use `enumerate()` to start showing number as 1.

To allow customer to add items in cart, I have created empty cart as empty list.

```
cart = []
```

Next, I started a loop control flow.

Receive menu number by customer input with `input()`.

This is `while` loop where if you continue to order food, it will keep looping until you finish buying by typing `done`.

If customer wants to order, user can input order in `order_menus` with number and then converts to integer with `int()` and stores to `choices`. *(Since `input()` return as TEXT so it has to convert)*

```
while (True):
  order_menus = input("What would you like to order?: ")

  if order_menus.lower() == "done":
    break
  try:
    choices = int(order_menus)

    if choices > 0 and choices <= len(menus):
      item = list(menus.keys())[choices - 1]
      cart.append(item)
      print(f"> {item} has been added to your cart.")
    else:
      print("Invalid menu! Please select available menus (Cho
ose 1 to 6)")
  except ValueError:
    print("Invalid input! Please enter a number or 'done' to
finish ordering")
```

If `choices` is in the range, `menus` will convert from dictionary → list and indexing with `choices - 1` since index in Python starts from 0.

The menu name stores in `item` and then it stores in `cart` and display a message.

If you use invalid one, it will show warning message.

`try-except` uses to prevent error when user type TEXT instead of NUMBER because `order_menus` → `int()` → `choices` = It cannot convert TEXT → INTEGER.

Now, we are outside the loop.

If `cart` is empty, it will show message that it has nothing. It also ends the function with `return`.

```
if len(cart) == 0:
  print("No items ordered. See you next time!")
  return
else:
  print("-----Summary of Your Order-----")
  for item in cart:
    print(f"{item}")

  total_price = sum(menus[item] for item in cart)
  print(f">> Total price: ${total_price}")
```

You will need to order again by execute `order_pizza()` function.

If the `cart` is not empty, it returns summary of product items and total price.

Finally, user has to choose payment method.

There are 3 ways to choose.

```
print("-----Payment Methods-----")
payment = ["Credit/Debit Card", "Cash On Delivery", "PromptPa
y"]
```

```
for i, item in enumerate(payment, start = 1):
  print(f"{i}: {item}")
```

And then I created another loop.

If valid, it will print final message that order is completed.

If not, it shows warning message and you have to input a valid one.

```
while(True):
  try:
    payment_user = int(input("Please enter your payment: "))
- 1
    if (payment_user >= 0) and (payment_user < len(payment)):
      print(f"Thank you, {name}. Paid via {payment[payment_us
er]}. Your food will be ready in 30 minutes")
      break
    else:
      print("Invalid payment! Please select available payment
(Choose 1 to 3)")
  except ValueError:
    print("Invalid input! Please enter a number")
```

And that's it. Let's see some scenarios.

Result

Scenario 1: Completed Order

```
Welcome to La Rebanada! What is your name?
What is your name?: Blitz
Good day, Blitz. What would you like to order?
-----Menus-----
```

```
1: Pepperoni: $30
2: Double Cheese: $35
3: Deluxe: $40
4: French Fries: $20
5: Coca Cola: $10
6: Water: $5
What would you like to order?: 1
> Pepperoni has been added to your cart.
What would you like to order?: 2
> Double Cheese has been added to your cart.
What would you like to order?: 4
> French Fries has been added to your cart.
What would you like to order?: 6
> Water has been added to your cart.
What would you like to order?: done
-----Summary of Your Order-----
Pepperoni
Double Cheese
French Fries
Water
>> Total price: $90
-----Payment Methods-----
1: Credit/Debit Card
2: Cash On Delivery
3: PromptPay
Please enter your payment: 1
Thank you, Blitz. Paid via Credit/Debit Card. Your food will
be ready in 30 minutes
```

Scenario 2: No Item in a Cart

```
Welcome to La Rebanada! What is your name?
What is your name?: Blitz
Good day, Blitz. What would you like to order?
-----Menus-----
```

```
1: Pepperoni: $30
2: Double Cheese: $35
3: Deluxe: $40
4: French Fries: $20
5: Coca Cola: $10
6: Water: $5
What would you like to order?: done
No items ordered. See you next time!
```

Scenario 3: Completed Order with Warning Message

```
Welcome to La Rebanada! What is your name?
What is your name?: Blitz
Good day, Blitz. What would you like to order?
-----Menus-----
1: Pepperoni: $30
2: Double Cheese: $35
3: Deluxe: $40
4: French Fries: $20
5: Coca Cola: $10
6: Water: $5
What would you like to order?: 7
Invalid menu! Please select available menus (Choose 1 to 6)
What would you like to order?: a
Invalid input! Please enter a number or 'done' to finish orde
ring
What would you like to order?: 1
> Pepperoni has been added to your cart.
What would you like to order?: done
-----Summary of Your Order-----
Pepperoni
>> Total price: $30
-----Payment Methods-----
1: Credit/Debit Card
2: Cash On Delivery
```

```
3: PromptPay
Please enter your payment: 4
Invalid payment! Please select available payment (Choose 1 to
3)
Please enter your payment: a
Invalid input! Please enter a number
Please enter your payment: 1
Thank you, Blitz. Paid via Credit/Debit Card. Your food will
be ready in 30 minutes
```
